

Your data mesh journey with

Data vision

Understand your current data journey, define a clear vision, and identify use cases and additional value

Data mesh assessment

Understand your data architecture and organizational structure; align it with data mesh roles and responsibilities

Data mesh design

Design your future data architecture and align it with your existing data platform components

Change journey

Adapt roles from centralized to decentralized teams and communicate them effectively within your organization

Data mesh implementation

Build the necessary data mesh platform features and create a set of data products

Revolutionizing data management

Data mesh is a revolutionary approach to data management that empowers organizations to effectively leverage their data assets.

Data mesh emphasizes decentralized ownership and domain-oriented thinking, enabling domain experts to take responsibility for their own data.

Do these challenges sound familiar to you?

Bottleneck in the centralized data team with low business understanding

Organizationally

Accelerated time-to-insights and increased **scalability** through decentralized structure and domain knowledge

Limited data analysis and difficulty in tracking the origin of data

Technically

Data is treated as a product to enhance its **value, visibility, and quality**

Long processes and **lack of flexibility** through top-down governance

Operationally

Domain teams manage their own processes according to their needs

High maintenance efforts and **difficult integration** of platforms and tools

Architecturally

Future-proof data architecture enhanced through integrated **self-service platform**

We plan, build, and run your future data landscape – tailored to your needs.
